

# Landia Wins New Wastewater Mixer and Pump Contract

August 24, 2018

Landia has supplied North Aqaba, Jordan, with flowmakers for the expanding wastewater treatment plant which will also see the installation of long-lasting submersible mixers and re-circulation pumps. The wastewater treatment plant is being expanded to meet the demand caused by North Aqaba's rapid growth due to extensive construction of new hotels and resorts.

Working in close conjunction with its local partner, Modern Industrial Services, Landia has provided a total of 23 units, which decreases the number of mixers in the plant's anoxic tanks from sixteen to eight. This will ultimately reduce installation and ongoing operational costs for many years to come.

Thorkild Maagaard, Export Sales director at Landia, commented: "We are very proud to be working in Jordan, where engineers have a firm belief and vision in creating a facility that is designed and built with robust, efficient

equipment that will stand the test of time. Offering a lifetime guarantee on our stainless-steel propellers shows that we can stand by the proven worldwide track record of our pumps and mixers".

Expansion of the Aqaba facility, which will feature a new 12,000m<sup>3</sup>/day mechanical wastewater treatment plant, will also include systems for reclaimed urban and agricultural water, as well as a new flow-splitter to separate influent from the mechanical plant and natural processes.
